

DEPARTMENT OF COMPUTER SCIENCE AND ENGINEERING

Course Code & Name : CSB1332 & DESIGN PROJECT
Year / Semester : III / VI
Section : C
Title of the Project : WI-FI INTRUSION DETECTION SYSTEM

S. No.	Students Name	Register Number
1.	RAJEV SHREE U	2303811710422130
2.	SHAJATHI BEE M	2303811710422141
3.	SHIBANI S	2303811710422147
4.	SOWMIYAA VS	2303811710422154

ABSTRACT

The Wi-Fi Intrusion Detection System (WIDS) is designed to enhance the security of wireless networks by continuously monitoring, analyzing, and detecting unauthorized access and malicious activities. With the increasing reliance on wireless communication, networks are highly vulnerable to threats such as rogue access points, spoofing, and denial-of-service attacks. The proposed system utilizes a combination of signature-based and anomaly-based detection techniques to identify both known and unknown threats effectively. It captures and processes wireless network data, analyzes traffic patterns, and classifies network risks into different levels. Upon detecting suspicious activity, the system generates real-time alerts and maintains logs for further analysis. The system is implemented using Python and Flask, providing a user-friendly interface for monitoring network status. Overall, the solution improves network confidentiality, integrity, and availability by offering a scalable, efficient, and proactive approach to wireless security.
